

SOFTWARE TESTING

Black-Box Testing Techniques

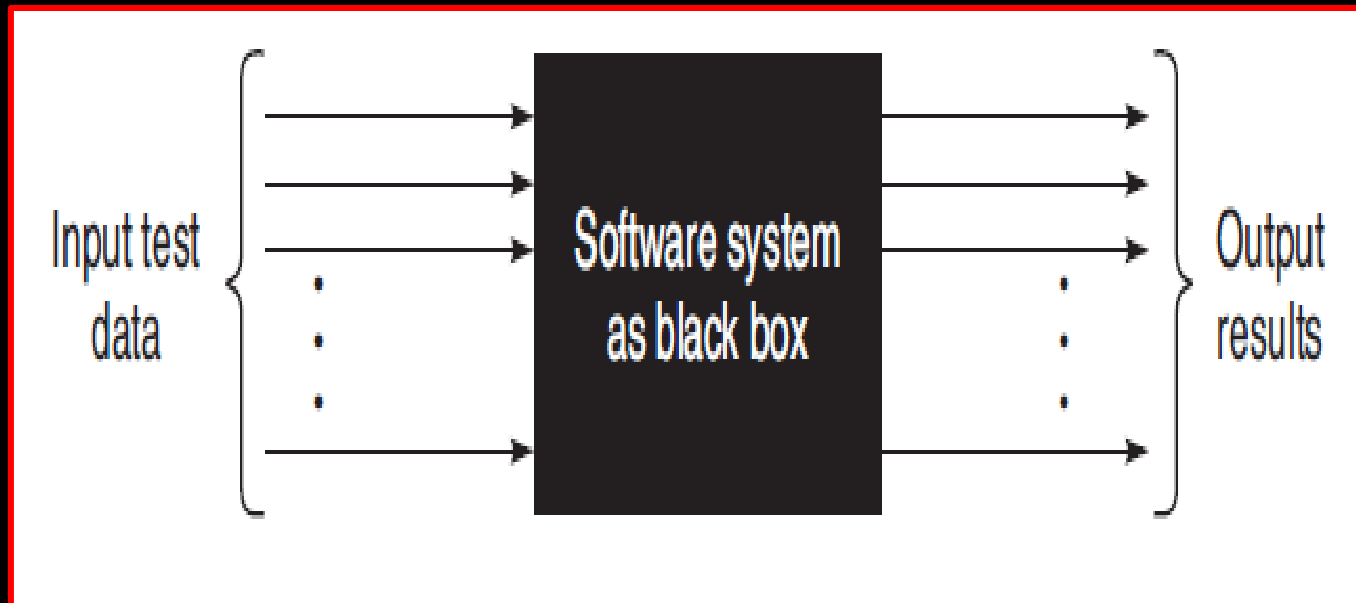

Dr. ARIVUSELVAN.K

Associate Professor – (SCORE)

VIT University

Dynamic Testing: Black-Box Testing

In black-box technique, **Input test data is given to the system**, which is a **black box to the tester**, and **results are checked against expected outputs** after executing the software.

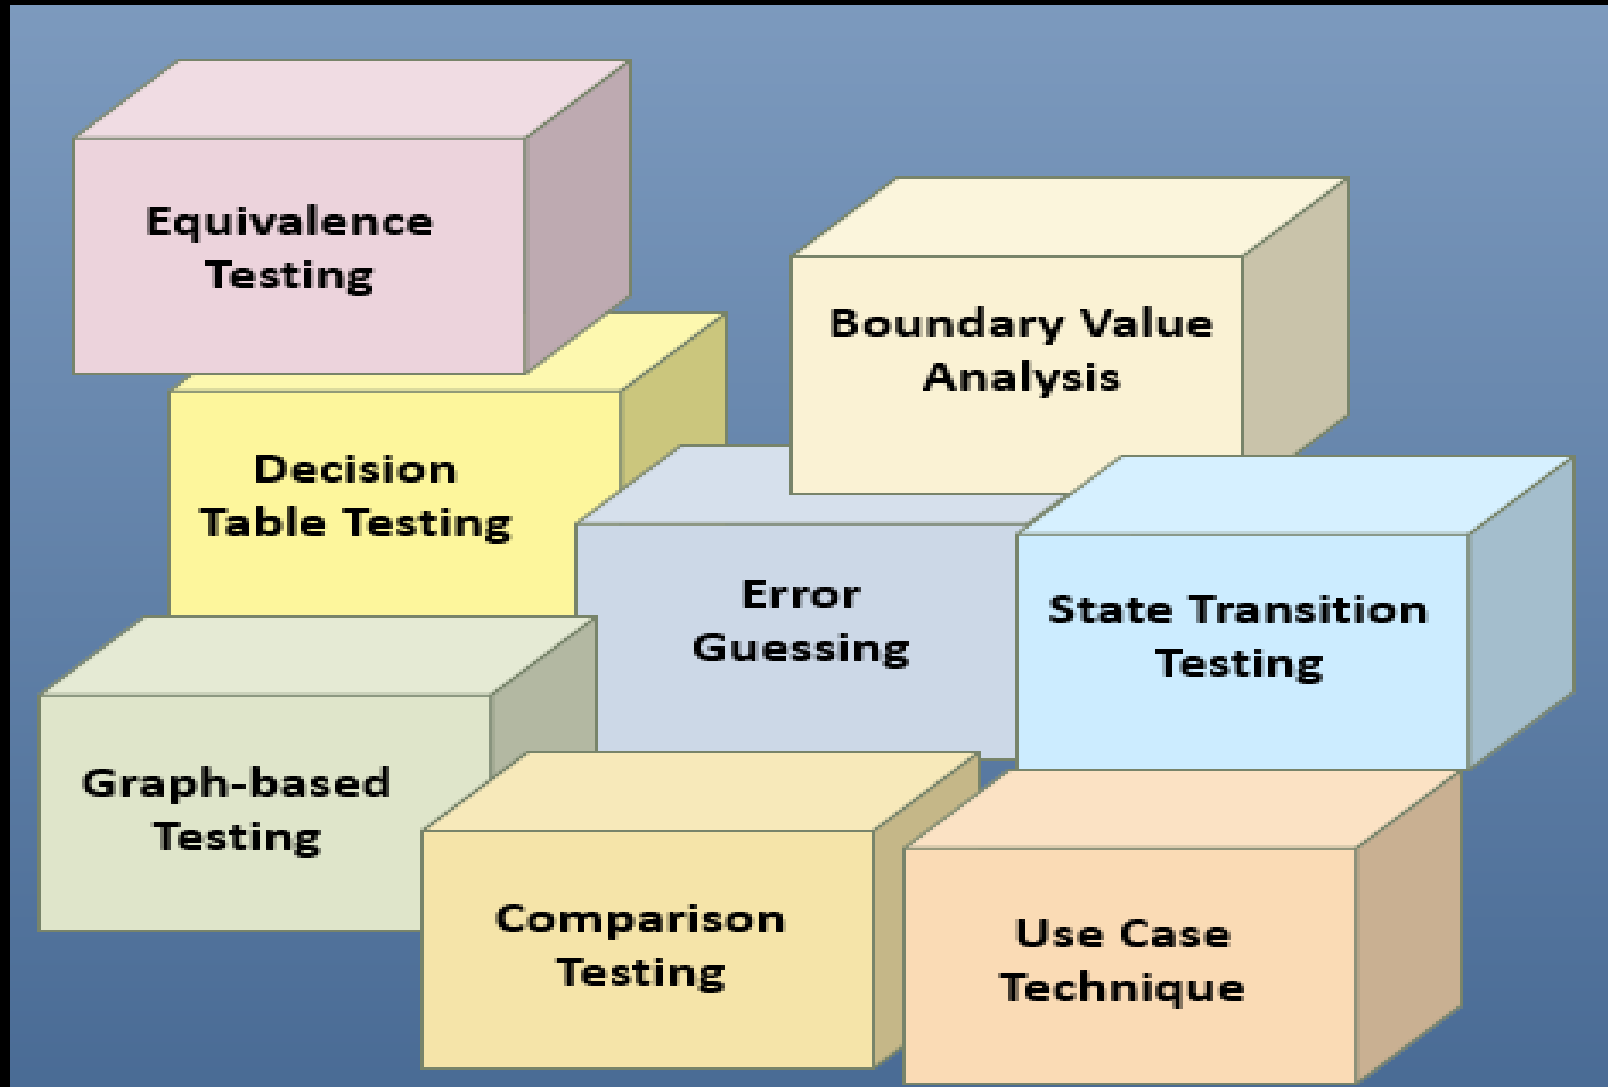

Dynamic Testing: Black-Box Testing

Black-box testing **attempts to find errors** in the following categories:

- To test the **functional validity** of the software, so that incorrect or missing functions can be recognized.
- To test the **maximum load or stress on the system**.

Black-Box Testing

[Test Case Design Techniques]

BOUNDARY VALUE ANALYSIS (BVA)

BOUNDARY VALUE ANALYSIS (BVA)

It is used for developing test cases to test the boundaries which separates the continuous range of inputs.

The boundaries are identified as part of this technique and then the test cases are written.

For any scenario, we can write:

- Lower boundary cases (using values just below the boundary specified)
- Upper Boundary cases (Using values just above the boundary specified)
- On boundary cases (Using the boundary values)

TYPES OF BOUNDARY VALUE ANALYSIS

BVA offers several methods to design test cases as listed below:

(1) **BOUNDARY VALUE CHECKING [BVC]**

(2) **ROBUSTNESS TESTING METHOD [RTM]**

(3) **WORST-CASE TESTING METHOD [WTM]**

(1) BOUNDARY VALUE CHECKING (BVC)

The **test cases** are designed by holding **one variable** at its **extreme value** and **other variables** at their **nominal values** in the input domain.

The variable at its **extreme value** can be selected at:

- (a) Minimum value (**Min**)
- (b) Value just above the minimum value (**Min+**)
- (c) Maximum value (**Max**)
- (d) Value just below the maximum value (**Max-**)

Let us take the example of **two variables**, **A** and **B**.

If we consider all the **below combinations** with **nominal values**, then following test cases can be designed:

1. A_{nom}, B_{min}
2. A_{nom}, B_{min+}
3. A_{nom}, B_{max}
4. A_{nom}, B_{max-}
5. A_{min}, B_{nom}
6. A_{min+}, B_{nom}
7. A_{max}, B_{nom}
8. A_{max-}, B_{nom}
9. A_{nom}, B_{nom}

It can be generalized that for n variables in a module, $4n + 1$ test cases can be designed with boundary value checking method.

(2) ROBUSTNESS TESTING METHOD

Test cases are designed considering the **below points** in addition to BVC, it is called **robustness testing**.

(a) A value just **greater than the Maximum value** (**Max⁺**)

(b) A value just **less than Minimum value** (**Min⁻**)

1. A_{nom}, B_{min}
2. A_{nom}, B_{min+}
3. A_{nom}, B_{max}
4. A_{nom}, B_{max-}
5. A_{min}, B_{nom}
6. A_{min+}, B_{nom}
7. A_{max}, B_{nom}
8. A_{max-}, B_{nom}
9. A_{nom}, B_{nom}

10. A_{max+}, B_{nom}
11. A_{min-}, B_{nom}
12. A_{nom}, B_{max+}
13. A_{nom}, B_{min-}

It can be generalized that for n variables in a module, $6n + 1$ test cases can be designed with robustness testing method.

(3) WORST-CASE TESTING METHOD

We can again **extend the concept of BVC** by assuming **more than one variable on the boundary**.

We can **add the following test cases** to the **list of 9 test cases** designed in BVC as:

1. $A_{\text{nom}}, B_{\text{min}}$
2. $A_{\text{nom}}, B_{\text{min}+}$
3. $A_{\text{nom}}, B_{\text{max}}$
4. $A_{\text{nom}}, B_{\text{max}-}$
5. $A_{\text{min}}, B_{\text{nom}}$
6. $A_{\text{min}+}, B_{\text{nom}}$
7. $A_{\text{max}}, B_{\text{nom}}$
8. $A_{\text{max}-}, B_{\text{nom}}$
9. $A_{\text{nom}}, B_{\text{nom}}$
10. $A_{\text{min}}, B_{\text{min}}$
11. $A_{\text{min}+}, B_{\text{min}}$
12. $A_{\text{min}}, B_{\text{min}+}$
13. $A_{\text{min}+}, B_{\text{min}+}$

14. $A_{\text{max}}, B_{\text{min}}$
15. $A_{\text{max}-}, B_{\text{min}}$
16. $A_{\text{max}}, B_{\text{min}+}$
17. $A_{\text{max}-}, B_{\text{min}+}$
18. $A_{\text{min}}, B_{\text{max}}$
19. $A_{\text{min}+}, B_{\text{max}}$
20. $A_{\text{min}}, B_{\text{max}-}$
21. $A_{\text{min}+}, B_{\text{max}-}$
22. $A_{\text{max}}, B_{\text{max}}$
23. $A_{\text{max}-}, B_{\text{max}}$
24. $A_{\text{max}}, B_{\text{max}-}$
25. $A_{\text{max}-}, B_{\text{max}-}$

It can be generalized that for n variables in a module, 5^n test cases can be designed with robustness testing method.

Example -1

Program reads an integer number within the range [1,100] and determines whether it is a prime number or not. Design test cases for this program using BVC, robust testing, and worst-case testing methods.

(a) Test cases using **BVC**:

Since there is **one variable**, the total number of test cases will be $4n + 1 = 5$.

In our example, the set of **minimum and maximum values** is shown below:

Min value = 1

Min⁺ value = 2

Max value = 100

Max⁻ value = 99

Nominal value = 50–55

Using these values, **test cases** can be **designed** as shown below:

| Test Case ID | Integer Variable | Expected Output |
|--------------|------------------|--------------------|
| 1 | 1 | Not a prime number |
| 2 | 2 | Prime number |
| 3 | 100 | Not a prime number |
| 4 | 99 | Not a prime number |
| 5 | 53 | Prime number |

(b) Test cases using **robust testing**:

Since there is **one variable**, the total **number of test cases** will be **$6n + 1 = 7$** .

The set of boundary values is shown below:

| |
|------------------------------|
| Min value = 1 |
| Min ⁻ value = 0 |
| Min ⁺ value = 2 |
| Max value = 100 |
| Max ⁻ value = 99 |
| Max ⁺ value = 101 |
| Nominal value = 50–55 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | Integer Variable | Expected Output |
|--------------|------------------|--------------------|
| 1 | 0 | Invalid input |
| 2 | 1 | Not a prime number |
| 3 | 2 | Prime number |
| 4 | 100 | Not a prime number |
| 5 | 99 | Not a prime number |
| 6 | 101 | Invalid input |
| 7 | 53 | Prime number |

(C) Test cases using **worst-case testing**:

Since there is **one variable**, the **total number of test cases** will be **$5^n = 5$** .

Therefore, the **number of test cases** will be **same as BVC**.

Example- 2

A program computes a^b where a lies in the range $[1,10]$ and b within $[1,5]$. Design test cases for this program using BVC, robust testing, and worst-case testing methods.

(a) Test cases using **BVC**:

Since there are **two variables**, (a and b) the total number of test cases will be $4n + 1 = 9$. The set of boundary values is shown below:

| | a | b |
|------------------------|----|---|
| Min value | 1 | 1 |
| Min ⁺ value | 2 | 2 |
| Max value | 10 | 5 |
| Max ⁻ value | 9 | 4 |
| Nominal value | 5 | 3 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | a | b | Expected Output |
|--------------|----|---|-----------------|
| 1 | 1 | 3 | 1 |
| 2 | 2 | 3 | 8 |
| 3 | 10 | 3 | 1000 |
| 4 | 9 | 3 | 729 |
| 5 | 5 | 1 | 5 |
| 6 | 5 | 2 | 25 |
| 7 | 5 | 4 | 625 |
| 8 | 5 | 5 | 3125 |
| 9 | 5 | 3 | 125 |

(b) Test cases using **robust testing**:

Since there are **two variables, a and b**, the **total number of test cases** will be **$6n + 1 = 13$** .

The set of boundary values is shown below:

| | a | b |
|------------------------|----|---|
| Min value | 1 | 1 |
| Min ⁻ value | 0 | 0 |
| Min ⁺ value | 2 | 2 |
| Max value | 10 | 5 |
| Max ⁺ value | 11 | 6 |
| Max ⁻ value | 9 | 4 |
| Nominal value | 5 | 3 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | a | b | Expected output |
|--------------|----|---|-----------------|
| 1 | 0 | 3 | Invalid input |
| 2 | 1 | 3 | 1 |
| 3 | 2 | 3 | 8 |
| 4 | 10 | 3 | 1000 |
| 5 | 11 | 3 | Invalid input |
| 6 | 9 | 3 | 729 |
| 7 | 5 | 0 | Invalid input |
| 8 | 5 | 1 | 5 |
| 9 | 5 | 2 | 25 |
| 10 | 5 | 4 | 625 |
| 11 | 5 | 5 | 3125 |
| 12 | 5 | 6 | Invalid input |
| 13 | 5 | 3 | 125 |

(C) Test cases using **worst-case testing**:

Since there are **two variables**, **a** and **b**, the total number of test cases will be **$5^n = 25$** .

The set of boundary values is shown below:

| | a | b |
|------------------------|----|---|
| Min value | 1 | 1 |
| Min ⁺ value | 2 | 2 |
| Max value | 10 | 5 |
| Max ⁻ value | 9 | 4 |
| Nominal value | 5 | 3 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | a | b | Expected Output |
|--------------|----|---|-----------------|
| 1 | 1 | 1 | 1 |
| 2 | 1 | 2 | 1 |
| 3 | 1 | 3 | 3 |
| 4 | 1 | 4 | 1 |
| 5 | 1 | 5 | 1 |
| 6 | 2 | 1 | 2 |
| 7 | 2 | 2 | 4 |
| 8 | 2 | 3 | 8 |
| 9 | 2 | 4 | 16 |
| 10 | 2 | 5 | 32 |
| 11 | 5 | 1 | 5 |
| 12 | 5 | 2 | 25 |
| 13 | 5 | 3 | 125 |
| 14 | 5 | 4 | 625 |
| 15 | 5 | 5 | 3125 |
| 16 | 9 | 1 | 9 |
| 17 | 9 | 2 | 81 |
| 18 | 9 | 3 | 729 |
| 19 | 9 | 4 | 6561 |
| 20 | 9 | 5 | 59049 |
| 21 | 10 | 1 | 10 |
| 22 | 10 | 2 | 100 |
| 23 | 10 | 3 | 1000 |
| 24 | 10 | 4 | 10000 |
| 25 | 10 | 5 | 100000 |

Example- 3

A program determines the next date in the calendar. Its input is entered in the form of <ddmmyyyy> with the following range:

$$1 \leq mm \leq 12$$

$$1 \leq dd \leq 31$$

$$1900 \leq yyyy \leq 2025$$

Its output would be the next date or it will display ‘invalid date.’

Design test cases for this program using BVC, robust testing, and worst-case testing methods.

(a) Test cases using **BVC**:

Since there are **three variables**, (month, day, and year) the total number of test cases will be **$4n + 1 = 13$** . The set of boundary values is shown below:

| | Month | Day | Year |
|------------------------|-------|-----|------|
| Min value | 1 | 1 | 1900 |
| Min ⁺ value | 2 | 2 | 1901 |
| Max value | 12 | 31 | 2025 |
| Max ⁻ value | 11 | 30 | 2024 |
| Nominal value | 6 | 15 | 1962 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | Month | Day | Year | Expected Output |
|--------------|-------|-----|------|-----------------|
| 1 | 1 | 15 | 1962 | 16-1-1962 |
| 2 | 2 | 15 | 1962 | 16-2-1962 |
| 3 | 11 | 15 | 1962 | 16-11-1962 |
| 4 | 12 | 15 | 1962 | 16-12-1962 |
| 5 | 6 | 1 | 1962 | 2-6-1962 |
| 6 | 6 | 2 | 1962 | 3-6-1962 |
| 7 | 6 | 30 | 1962 | 1-7-1962 |
| 8 | 6 | 31 | 1962 | Invalid input |
| 9 | 6 | 15 | 1900 | 16-6-1900 |
| 10 | 6 | 15 | 1901 | 16-6-1901 |
| 11 | 6 | 15 | 2024 | 16-6-2024 |
| 12 | 6 | 15 | 2025 | 16-6-2025 |
| 13 | 6 | 15 | 1962 | 16-6-1962 |

(b) Test cases using **robust testing**:

The total number of test cases will be $6n + 1 = 19$. The set of boundary values is shown below:

The set of boundary values is shown below:

| | Month | Day | Year |
|------------------------|-------|-----|------|
| Min ⁻ value | 0 | 0 | 1899 |
| Min value | 1 | 1 | 1900 |
| Min ⁺ value | 2 | 2 | 1901 |
| Max value | 12 | 31 | 2025 |
| Max ⁻ value | 11 | 30 | 2024 |
| Max ⁺ value | 13 | 32 | 2026 |
| Nominal value | 6 | 15 | 1962 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | Month | Day | Year | Expected Output |
|--------------|-------|-----|------|-----------------|
| 1 | 0 | 15 | 1962 | Invalid date |
| 2 | 1 | 15 | 1962 | 16-1-1962 |
| 3 | 2 | 15 | 1962 | 16-2-1962 |
| 4 | 11 | 15 | 1962 | 16-11-1962 |
| 5 | 12 | 15 | 1962 | 16-12-1962 |
| 6 | 13 | 15 | 1962 | Invalid date |
| 7 | 6 | 0 | 1962 | Invalid date |
| 8 | 6 | 1 | 1962 | 2-6-1962 |
| 9 | 6 | 2 | 1962 | 3-6-1962 |
| 10 | 6 | 30 | 1962 | 1-7-1962 |

| | | | | |
|----|---|----|------|---------------|
| 11 | 6 | 31 | 1962 | Invalid input |
| 12 | 6 | 32 | 1962 | Invalid date |
| 13 | 6 | 15 | 1899 | Invalid date |
| 14 | 6 | 15 | 1900 | 16-6-1900 |
| 15 | 6 | 15 | 1901 | 16-6-1901 |
| 16 | 6 | 15 | 2024 | 16-6-2024 |
| 17 | 6 | 15 | 2025 | 16-6-2025 |
| 18 | 6 | 15 | 2026 | Invalid date |
| 19 | 6 | 15 | 1962 | 16-6-1962 |

(C) Test cases using **worst-case testing**:

The total number of test cases will be $5^n = 125$.

The set of boundary values is shown below:

| | Month | Day | Year |
|------------------------|-------|-----|------|
| Min value | 1 | 1 | 1900 |
| Min ⁺ value | 2 | 2 | 1901 |
| Max value | 12 | 31 | 2025 |
| Max ⁻ value | 11 | 30 | 2024 |
| Nominal value | 6 | 15 | 1962 |

Using these values, **test cases** can be designed as shown below:

| Test Case ID | Month | Day | Year | Expected Output |
|--------------|-------|-----|------|-----------------|
| 1 | 1 | 1 | 1900 | 2-1-1900 |
| 2 | 1 | 1 | 1901 | 2-1-1901 |
| 3 | 1 | 1 | 1962 | 2-1-1962 |
| 4 | 1 | 1 | 2024 | 2-1-2024 |
| 5 | 1 | 1 | 2025 | 2-1-2025 |
| 6 | 1 | 2 | 1900 | 3-1-1900 |
| 7 | 1 | 2 | 1901 | 3-1-1901 |
| 8 | 1 | 2 | 1962 | 3-1-1962 |
| 9 | 1 | 2 | 2024 | 3-1-2024 |
| 10 | 1 | 2 | 2025 | 3-1-2025 |
| 11 | 1 | 15 | 1900 | 16-1-1900 |
| 12 | 1 | 15 | 1901 | 16-1-1901 |
| 13 | 1 | 15 | 1962 | 16-1-1962 |
| 14 | 1 | 15 | 2024 | 16-1-2024 |
| 15 | 1 | 15 | 2025 | 16-1-2025 |
| 16 | 1 | 30 | 1900 | 31-1-1900 |

| | | | | |
|----|---|----|------|--------------|
| 17 | 1 | 30 | 1901 | 31-1-1901 |
| 18 | 1 | 30 | 1962 | 31-1-1962 |
| 19 | 1 | 30 | 2024 | 31-1-2024 |
| 20 | 1 | 30 | 2025 | 31-1-2025 |
| 21 | 1 | 31 | 1900 | 1-2-1900 |
| 22 | 1 | 31 | 1901 | 1-2-1901 |
| 23 | 1 | 31 | 1962 | 1-2-1962 |
| 24 | 1 | 31 | 2024 | 1-2-2024 |
| 25 | 1 | 31 | 2025 | 1-2-2025 |
| 26 | 2 | 1 | 1900 | 2-2-1900 |
| 27 | 2 | 1 | 1901 | 2-2-1901 |
| 28 | 2 | 1 | 1962 | 2-2-1962 |
| 29 | 2 | 1 | 2024 | 2-1-2024 |
| 30 | 2 | 1 | 2025 | 2-2-2025 |
| 31 | 2 | 2 | 1900 | 3-2-1900 |
| 32 | 2 | 2 | 1901 | 3-2-1901 |
| 33 | 2 | 2 | 1962 | 3-2-1962 |
| 34 | 2 | 2 | 2024 | 3-2-2024 |
| 35 | 2 | 2 | 2025 | 3-2-2025 |
| 36 | 2 | 15 | 1900 | 16-2-1900 |
| 37 | 2 | 15 | 1901 | 16-2-1901 |
| 38 | 2 | 15 | 1962 | 16-2-1962 |
| 39 | 2 | 15 | 2024 | 16-2-2024 |
| 40 | 2 | 15 | 2025 | 16-2-2025 |
| 41 | 2 | 30 | 1900 | Invalid date |
| 42 | 2 | 30 | 1901 | Invalid date |
| 43 | 2 | 30 | 1962 | Invalid date |
| 44 | 2 | 30 | 2024 | Invalid date |
| 45 | 2 | 30 | 2025 | Invalid date |
| 46 | 2 | 31 | 1900 | Invalid date |
| 47 | 2 | 31 | 1901 | Invalid date |
| 48 | 2 | 31 | 1962 | Invalid date |
| 49 | 2 | 31 | 2024 | Invalid date |
| 50 | 2 | 31 | 2025 | Invalid date |
| 51 | 6 | 1 | 1900 | 2-6-1900 |
| 52 | 6 | 1 | 1901 | 2-6-1901 |
| 53 | 6 | 1 | 1962 | 2-6-1962 |
| 54 | 6 | 1 | 2024 | 2-6-2024 |

| | | | | |
|----|----|----|------|--------------|
| 55 | 6 | 1 | 2025 | 2-6-2025 |
| 56 | 6 | 2 | 1900 | 3-6-1900 |
| 57 | 6 | 2 | 1901 | 3-6-1901 |
| 58 | 6 | 2 | 1962 | 3-6-1962 |
| 59 | 6 | 2 | 2024 | 3-6-2024 |
| 60 | 6 | 2 | 2025 | 3-6-2025 |
| 61 | 6 | 15 | 1900 | 16-6-1900 |
| 62 | 6 | 15 | 1901 | 16-6-1901 |
| 63 | 6 | 15 | 1962 | 16-6-1962 |
| 64 | 6 | 15 | 2024 | 16-6-2024 |

EQUIVALENCE CLASS TESTING

EQUIVALENCE CLASS PARTITIONING

Equivalence partitioning is also known as "Equivalence Class Partitioning". The whole range of input data for a given requirement are grouped into several sets or equivalence classes.

Equivalence classes are determined in such a way that all the input values in a input data range produce the same output when it is processed by the software.

EQUIVALENCE CLASS PARTITIONING

Examples :

Price filter for any ecommerce site is already designed with Equivalence partitioning in mind.

Price

- ☐ UNDER \$25
- ☐ \$25 TO \$50
- ☐ \$50 TO \$100
- ☐ \$100 TO \$200
- ☐ \$200 & ABOVE

EQUIVALENCE CLASS PARTITIONING

University Grading systems.

| <u>Grade</u> | <u>Grade Points</u> | <u>Mark Range</u> |
|--------------|---------------------|-------------------|
| O | 10 | 91-100 |
| A+ | 9 | 81-90 |
| A | 8 | 71-80 |
| B+ | 7 | 61-70 |
| B | 6 | 50-60 |
| RA | 0 | 0 - 49 or <50 |

One more additional test case(For invalid data) is to test values which is greater than 100 and it should not be permitted.

Equivalence partitioning method for designing test cases has the following goals:

(1) Completeness:

Without executing **all the test cases**, we strive to **touch the completeness** of testing domain.

(2) Non-redundancy:

When the **test cases are executed** having **inputs from the same class**, then there is **redundancy** in executing the test cases.

Time and resources are wasted in executing these **redundant test cases**, as they explore the **same type of bug**.

To use **equivalence partitioning**, one needs to perform two steps:

(1) Identify **equivalence classes**

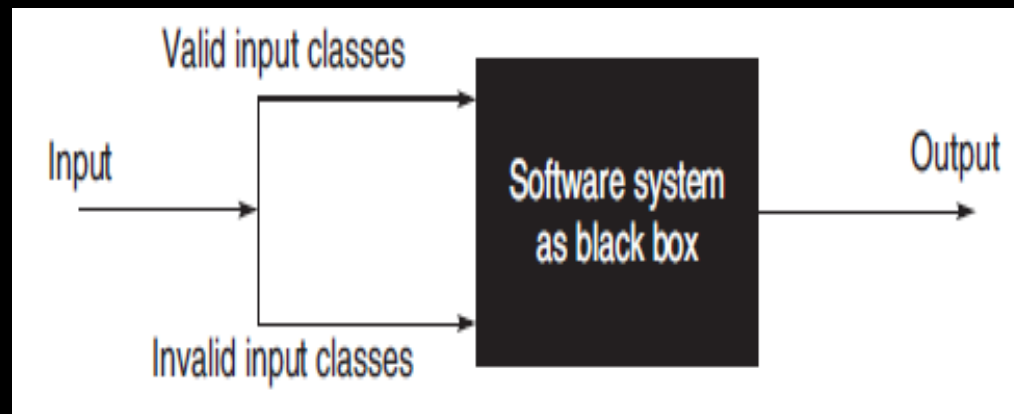

(2) Design **test cases**

(1) Identification Of Equivalent Classes:

Two types of classes can always be identified:

(i) Valid equivalence classes: These classes consider **valid inputs** to the program.

(ii) Invalid equivalence classes: Consider **invalid inputs** that will **generate error conditions or unexpected behavior** of the program

There are **no well-defined rules** for identifying equivalence classes, as it is a **heuristic process**.

However, **some guidelines are defined** for **forming equivalence classes**:

(i) Assign a **unique identification number** to each **equivalence class**.

(ii) Write a **new test case**. [covering as many of the uncovered valid equivalence classes as possible]

EQUIVALENCE PARTITION

Example:1

DATE (1 To 31)

| Invalid Partition | Valid Partition | Invalid Partition |
|-------------------|-----------------|-------------------|
| 0 | 1 | 32 |
| -1 | 2 | 33 |
| -2 | 3 | 34 |
| | | ... |
| | 31 | |

Example:2

USER NAME (6 To 10 Characters)

| Invalid Partition | Valid Partition | Invalid Partition |
|-------------------|-----------------|-------------------|
| 0 Character | 6 Character | 11 Character |
| 1 Character | 7 Character | 12 Character |
| 2 Character | 8 Character | ... |
| 3 Character | 9 Character | |
| 4 Character | 10 Character | |
| 5 Character | | |

Example:3

AGE (18 TO 80 Years, EXCEPT 60 To 65 Years)

| Invalid Partition | Valid Partition | Invalid Partition | Valid Partition | Invalid Partition |
|---------------------------------------|----------------------------------|-----------------------------------|-----------------------------------|---------------------------------------|
| 0 year 1 year 17 years | 18 years 59 years | 60 years 65 years | 66 years 80 years | 81 years 82 years |

EQUIVALENCE CLASS TESTING – Example 1

A program reads three numbers, **A, B, and C**, with a range [1, 50] and prints the **largest number**. Design test cases for this program using **equivalence class testing technique**.

Solution:

1. First we **partition** the domain of input as **valid input values** and **invalid values**, getting the following **classes**:

$$I_1 = \{ \langle A, B, C \rangle : 1 \leq A \leq 50 \}$$

$$I_2 = \{ \langle A, B, C \rangle : 1 \leq B \leq 50 \}$$

$$I_3 = \{ \langle A, B, C \rangle : 1 \leq C \leq 50 \}$$

$$I_4 = \{ \langle A, B, C \rangle : A < 1 \}$$

$$I_5 = \{ \langle A, B, C \rangle : A > 50 \}$$

$$I_6 = \{ \langle A, B, C \rangle : B < 1 \}$$

$$I_7 = \{ \langle A, B, C \rangle : B > 50 \}$$

$$I_8 = \{ \langle A, B, C \rangle : C < 1 \}$$

$$I_9 = \{ \langle A, B, C \rangle : C > 50 \}$$

Now the **test cases** can be designed from the above **derived classes**, taking **one test case** from **each class**.

The test cases are shown below:

| Test case ID | A | B | C | Expected result | Classes covered by the test case |
|--------------|----|----|----|-----------------|----------------------------------|
| 1 | 13 | 25 | 36 | C is greatest | I_1, I_2, I_3 |
| 2 | 0 | 13 | 45 | Invalid input | I_4 |
| 3 | 51 | 34 | 17 | Invalid input | I_5 |
| 4 | 29 | 0 | 18 | Invalid input | I_6 |
| 5 | 36 | 53 | 32 | Invalid input | I_7 |
| 6 | 27 | 42 | 0 | Invalid input | I_8 |
| 7 | 33 | 21 | 51 | Invalid input | I_9 |

$$I_1 = \{ \langle A, B, C \rangle : 1 \leq A \leq 50 \}$$

$$I_2 = \{ \langle A, B, C \rangle : 1 \leq B \leq 50 \}$$

$$I_3 = \{ \langle A, B, C \rangle : 1 \leq C \leq 50 \}$$

$$I_4 = \{ \langle A, B, C \rangle : A < 1 \}$$

$$I_5 = \{ \langle A, B, C \rangle : A > 50 \}$$

$$I_6 = \{ \langle A, B, C \rangle : B < 1 \}$$

$$I_7 = \{ \langle A, B, C \rangle : B > 50 \}$$

$$I_8 = \{ \langle A, B, C \rangle : C < 1 \}$$

$$I_9 = \{ \langle A, B, C \rangle : C > 50 \}$$

2. We can **derive another set of equivalence classes** based on some possibilities for three integers, **A, B, and C**. These are given below:

$$I_1 = \{ \langle A, B, C \rangle : A > B, A > C \}$$

$$I_2 = \{ \langle A, B, C \rangle : B > A, B > C \}$$

$$I_3 = \{ \langle A, B, C \rangle : C > A, C > B \}$$

$$I_4 = \{ \langle A, B, C \rangle : A = B, A \neq C \}$$

$$I_5 = \{ \langle A, B, C \rangle : B = C, A \neq B \}$$

$$I_6 = \{ \langle A, B, C \rangle : A = C, C \neq B \}$$

$$I_7 = \{ \langle A, B, C \rangle : A = B = C \}$$

| Test case ID | A | B | C | Expected Result | Classes Covered by the test case |
|--------------|----|----|----|---------------------|----------------------------------|
| 1 | 25 | 13 | 13 | A is greatest | I_1, I_5 |
| 2 | 25 | 40 | 25 | B is greatest | I_2, I_6 |
| 3 | 24 | 24 | 37 | C is greatest | I_3, I_4 |
| 4 | 25 | 25 | 25 | All three are equal | I_7 |

EQUIVALENCE CLASS TESTING

Example-2

A program **determines the next date** in the calendar. Its input is entered in the form of **<ddmmyyyy>** with the following range:

$$1 \leq \text{mm} \leq 12$$

$$1 \leq \text{dd} \leq 31$$

$$1900 \leq \text{yyyy} \leq 2025$$

Its **output** would be the **next date** or an error message 'invalid date.'.

Design test cases using **equivalence class partitioning method**.

Solution:

First we **partition the domain of input** in terms of **valid input values** and **invalid values**, getting the following classes:

$$I_1 = \{ \langle m, d, y \rangle : 1 \leq m \leq 12 \}$$

$$I_2 = \{ \langle m, d, y \rangle : 1 \leq d \leq 31 \}$$

$$I_3 = \{ \langle m, d, y \rangle : 1900 \leq y \leq 2025 \}$$

$$I_4 = \{ \langle m, d, y \rangle : m < 1 \}$$

$$I_5 = \{ \langle m, d, y \rangle : m > 12 \}$$

$$I_6 = \{ \langle m, d, y \rangle : d < 1 \}$$

$$I_7 = \{ \langle m, d, y \rangle : d > 31 \}$$

$$I_8 = \{ \langle m, d, y \rangle : y < 1900 \}$$

$$I_9 = \{ \langle m, d, y \rangle : y > 2025 \}$$

The **test cases** can be designed from the above derived classes are shown below:

| Test case ID | mm | dd | yyyy | Expected result | Classes covered by the test case |
|--------------|----|----|------|-----------------|----------------------------------|
| 1 | 5 | 20 | 1996 | 21-5-1996 | l_1, l_2, l_3 |
| 2 | 0 | 13 | 2000 | Invalid input | l_4 |
| 3 | 13 | 13 | 1950 | Invalid input | l_5 |
| 4 | 12 | 0 | 2007 | Invalid input | l_6 |
| 5 | 6 | 32 | 1956 | Invalid input | l_7 |
| 6 | 11 | 15 | 1899 | Invalid input | l_8 |
| 7 | 10 | 19 | 2026 | Invalid input | l_9 |

Equivalence class VS Boundary Value Analysis

Equivalence Class Partitioning

Valid & Invalid equivalence classes (ranges) of the input data domain are considered for test design & execution.

It considers input data values from a range of equivalence classes (intervals) of the input data domain.

It is significant in identifying bugs in-between the defined equivalence classes.

Boundary Value Analysis

It considers the following for input data values:

- Minimum - 1
- Minimum
- Minimum + 1
- Nominal
- Maximum - 1
- Maximum
- Maximum + 1

It considers input data values based on the defined boundaries of the input data domain.

It is significant in identifying bugs at the boundaries of the input data domain.
